

Aug 22, 2026

Meeting Aug 22, 2026 at 23:12 IST

Meeting records  Transcript

Summary

Evaluation preparations finalized with strategic presentation feedback, technical feature alignment, and confirmed project scope for government oversight.

Presentation and evaluation strategy

The evaluation panel will prioritize a live demonstration over slides, requiring a 3 to 4 minute presentation structure. The team decided to adopt a Progressive Web App platform to ensure broad accessibility.

System features and design

Officials will utilize a dashboard featuring artificial intelligence driven authenticity checks and satellite imagery to verify incident reports. The system incorporates multilingual support and automated geographic metadata extraction to prioritize data accuracy.

Monitoring and reporting capabilities

Future enhancements will focus on timeline reporting over 6 months to 2 years to track deforestation trends. The scope remains restricted to authorized land to provide actionable data for government authorities.

Decisions

Aligned

- **Presentation structure and duration finalized** The presentation structure is finalized to include system architecture and user roles, presented as a story, followed by a demo within a three to four-minute total duration.
- **Multilingual and speech-to-text support required** The application will implement multilingual support and a speech-to-text interface to ensure accessibility for the target community audience.
- **AI-generated image authenticity check integrated** The system will incorporate an authenticity check to flag potential AI-generated images during the user reporting process.
- **Deforestation data and predictive modeling priority** The team will prioritize utilizing deforestation datasets and applying machine learning techniques to predict potential upcoming hot zones.
- **Module integration deferral** The team will defer integrating the new deforestation processing module with the current application and will instead present it as a separate module to ensure a successful demo.
- **Timeline-based deforestation reporting** The solution will include timeline-based reporting for deforestation covering the last 6 months to 1 year to provide value for government officials.
- **OTP verification for user registration** The registration process for citizens and organizations will incorporate mobile phone verification using OTPs.

We've **updated the Decisions section** using your feedback.

Let us know what you think: [Helpful](#) or [Not Helpful](#)

Next steps

- ☐ [Veeresh Bhat, Tanisha Chouhan, Hussain Tarwalla, Aniket Anchule]
Implement Fake Image Detection: Develop and integrate a feature that

evaluates image authenticity to flag AI-generated content before it reaches government officials.

- ☐ [The group] Find Datasets: Search for and analyze deforestation datasets to improve model accuracy. Use this data to help distinguish between climate-related changes and actual encroachment.
- ☐ [The group] Predict Hot Zones: Apply machine learning techniques to identify and predict potential upcoming encroachment hot zones.
- ☐ [The group] Implement OTP Verification: Incorporate mobile phone OTP verification for user login and authentication modules.
- ☐ [The group] Update Demo Content: Include preventive measures in the solution and demonstrate deforestation analysis over the last 6 months for evaluation.
- ☐ [The group] Assign Presentation Roles: Determine which team members will present the demo and explain specific parts of the project to the evaluators.
- ☐ [The group] Prepare Contribution Summaries: Draft individual contribution summaries to clearly state each member's specific role in the project development.

Details

Did the screenshots in this section make your notes [better](#) or [worse](#)?

- **Meeting Logistics and Evaluation Timing:** AVANI SAKHAPARA joined the team to confirm the schedule for the upcoming evaluation, which is set for tomorrow between 3:00 and 4:00 ([00:34:43](#)).
- **Presentation Strategy and Evaluation Criteria:** AVANI SAKHAPARA advised the team to limit their presentation to 3-4 minutes, emphasizing that the primary focus must be on a live demo of the implementation rather than the PowerPoint presentation. The team was instructed to structure the presentation by first explaining the system architecture and user roles as a narrative, followed by a seamless transition to the demo. AVANI SAKHAPARA noted that because the evaluation panel will be seeing the project for the first time, clarity regarding the problem statement and user workflow is essential ([00:34:43](#)) ([00:43:54](#)).
- **Application Platform and Design:** The team chose to build a Progressive Web App (PWA) rather than a standard website to ensure portability, offline

accessibility, and better performance in areas with limited internet connectivity. This technical decision aims to make the application more accessible to the target demographic, specifically local community members and those in rural environments ([00:39:52](#)).

- **Trust Tier System and User Roles:** The team presented a three-tier trust system designed to help government officials prioritize incoming reports. Tier one includes community members who submit descriptions, photos, and videos. Tier two submissions include geo-tagged photos that are harder to falsify, while tier three is reserved for NGO organizations, which are automatically treated as the highest priority ([00:42:30](#)) ([00:54:37](#)). Veeresh Bhat explained that the system is designed to escalate the priority of a report if multiple sources corroborate an incident in the same 500-meter radius ([00:42:30](#)) ([00:53:06](#)).
- **Language Accessibility Features:** To ensure the application remains community-friendly, the team confirmed the integration of multilingual support, including English, Hindi, and Marathi ([00:47:09](#)) ([00:50:50](#)). Furthermore, they are implementing a speech-to-text feature that allows community members to provide incident descriptions in their native languages, which will be recorded and translated for the system ([00:49:05](#)).
- **Incident Reporting and Tracking:** Tanisha Chouhan demonstrated the incident reporting workflow, noting that the application automatically captures the user's longitudinal and latitudinal coordinates upon submission ([00:49:05](#)). Once a report is submitted, the citizen can track the status—including submission, processing, and under review stages—directly through the application ([00:50:50](#)).
- **Image Metadata and Geo-Tagging:** The team discussed the process for image uploads, confirming that the system extracts geographic metadata from photos to establish geo-tagging ([00:51:54](#)). If an image lacks geo-tagging, it is processed as a tier one submission until it is corroborated by other users or satellite verification, at which point the priority level may be adjusted ([00:53:06](#)).
- **Government Official Dashboard Functionality:** Tanisha Chouhan showcased the dashboard designed for government officials, which includes sections for jurisdiction management, status tracking, alert flagging, and report verification ([00:54:37](#)). Additionally, Veeresh Bhat indicated that the team is developing an AI-driven authenticity check to flag potentially deep-faked or AI-generated images, which will assign an authenticity score

to help officials prioritize reports that are most likely to be genuine (00:57:30).

- **Dashboard and User Interface Overview:** Tanisha Chouhan guided AVANI SAKHAPARA through the current dashboard interface, demonstrating the alert flags, signal types (citizen reports vs. satellite data), and confidence levels associated with incidents. The discussion covered the citizen reporting module, which displays specific report IDs, linked flags, reporter trust details, and submission dates. Tanisha Chouhan also showcased graphical representations of vegetation metrics and the administrative interface for managing user roles (00:59:14).

- Backend Analysis and Machine Learning Status:** AVANI SAKHAPARA asked about the project's backend analysis capabilities and machine learning implementation. Veeresh Bhat explained that while the system currently handles multiple reports from the same latitude and longitude, in-depth machine learning is still under development. AVANI SAKHAPARA emphasized the potential value of analyzing encroachment data from other regions to strengthen their solution ([01:00:19](#)).
- Government Workflow and Incident Verification:** The team discussed the government's role in verifying incidents within the dashboard. Veeresh Bhat explained that when the system identifies a hotspot through multiple citizen reports, government officials can physically verify the site. This process is supplemented by satellite imagery, which constantly monitors vegetation loss to alert officials to potential encroachment. The team clarified that their role is to provide data, leaving the legal proceedings and subsequent actions to the government authorities ([01:03:04](#)).
- Model Back-Testing and Seasonal Vegetation:** Veeresh Bhat introduced the concept of model back-testing to distinguish between actual encroachment and natural seasonal vegetation loss, such as leaf shedding. To prevent false positives, AVANI SAKHAPARA suggested incorporating deforestation datasets. The team discussed using these datasets to predict future hotspots and enable government officials to take preventive action ([01:06:01](#)).

- Satellite Imagery and Technical Parameters:** The team confirmed they are utilizing publicly available Sentinel-2 satellite data. The discussion

identified the use of PostGIS, NDVI (Normalized Difference Vegetation Index), and NDBI (Normalized Difference Built-up Index) as core technical parameters. AVANI SAKHAPARA advised the team to create a separate module for satellite image processing to demonstrate the functionality effectively, even if full integration with the main application is not yet complete ([01:09:22](#)).

- **Project Scope and System Integration:** The team affirmed that their processing logic is ready and requires integration with the main database. They clarified that the project scope focuses strictly on authorized tribal land and deforestation monitoring, ensuring the solution provides direct, relevant data for government jurisdictions rather than covering legally contested land ([01:13:53](#)).
- **Long-Term Reporting Features:** AVANI SAKHAPARA advised the team to implement timeline-based reporting features. Providing government officials with the ability to view forestation trends over six months, one year, and two years is essential for ensuring the adoption and utility of the solution for long-term monitoring ([01:17:41](#)).
- **User Interface and Authentication:** The team reviewed the user interface, which AVANI SAKHAPARA described as intuitive. The login process was discussed, noting the distinction between individual citizens and organizations that require validation. To enhance security and align with project goals, the team discussed implementing OTP (one-time password) verification for mobile users ([01:19:56](#)).

- **Presentation and Evaluation Preparation:** AVANI SAKHAPARA provided strategic advice for the upcoming hackathon presentation. They recommended that the team assign specific pitching roles, prepare to answer questions about individual contributions, and focus on demonstrating an end-to-end solution rather than relying solely on their presentation slides ([01:25:54](#)).
- **Post-Meeting Debrief and Planning:** Following the departure of AVANI SAKHAPARA, the team members—Hussain Tarwalla, Tanisha Chouhan, Veeresh Bhat, and Aniket Anchule—reflected on the feedback. They agreed to prioritize the differentiating features of their solution, such as the alert system and satellite imagery, and planned to divide the presentation responsibilities to ensure they successfully convey their project's value and demonstrate the complete system ([01:28:44](#)).
